Part 1

Part 2

Part 3:

A short paragraph (3–5 sentences) describing what was hardest to get right — coordinates, colors, loops, or something else — and how you solved it.

Coordinates were the hardest to get right because I was used to the top left corner being the origin (0,0), and I could not tell how far something had moved until I tried it over and over again until it was exactly where I wanted it. It was part 1 and part 3 that were the most frustrating with coordinates. The way I solved this issue was just to keep trying until everything looked exactly right. Along with struggling with coordinates, comes with struggling with irregular polygons (DrawPoly). The way I fixed this was also to keep running the program over and over until it looked just right. This would have been much better if I drew a reference of the coordinates.
